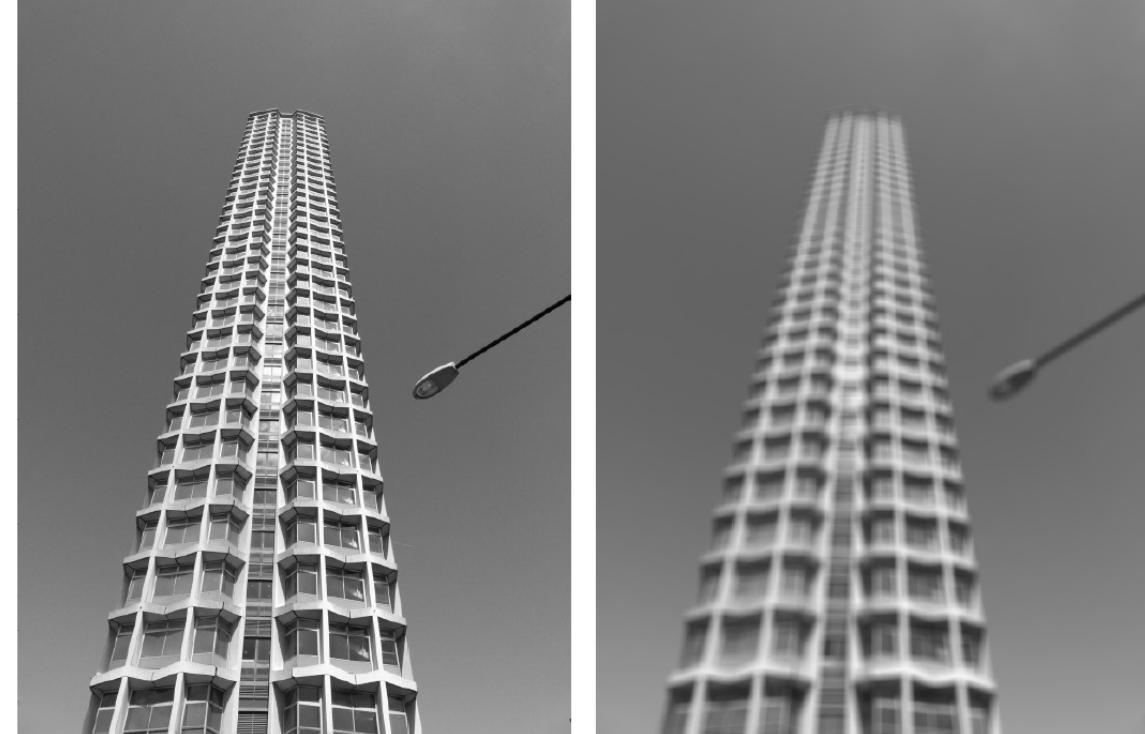

Image Filtering

Image Filtering

Learning outcomes:

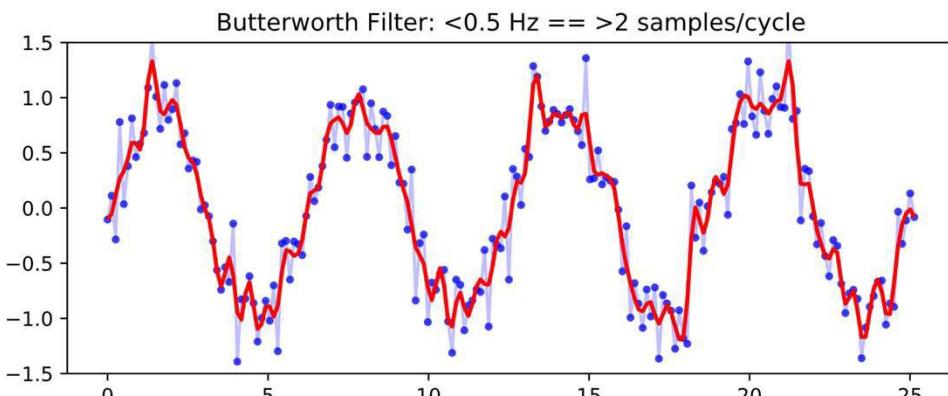

- Filter
- Image Filtering
- Low-pass Filter
- High-pass Filter
- Convolution
- Correlation
- Kernel
- Linearity and Shift Invariance
- Separability
- Sobel Filter
- Convolution
- Correlation & Template Matching
- Non-Linear Filters

Filtering

Definition

Filtering: An operation that modifies a (measured) signal.

<https://ggbaker.ca/data-science/media/butter4.svg>

- Modifications include
 - Removing undesirable components
 - Transforming signal in a desirable way
 - Extract specific components of a signal
- Can be analog or discrete signals
- Can be in any dimension

1D Filtering: Moving Average

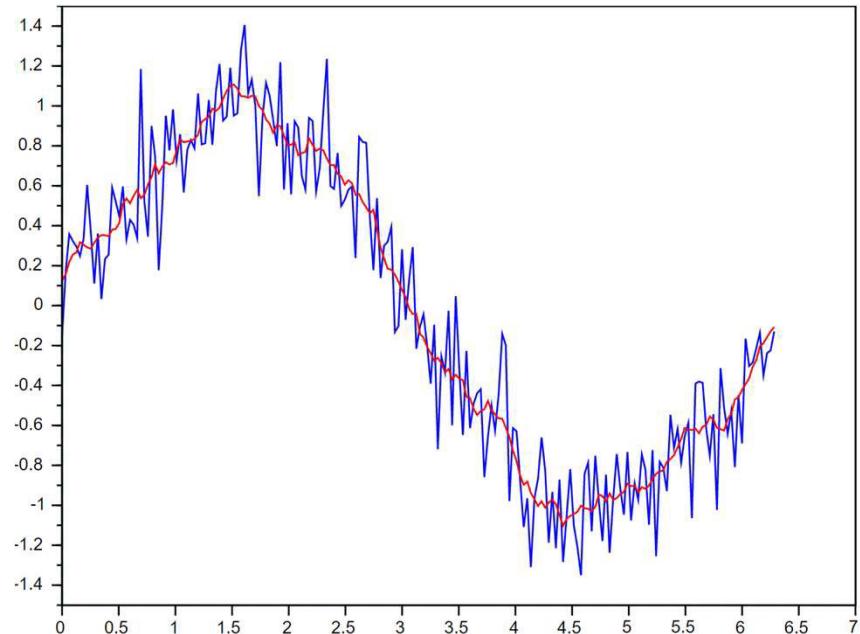

$$I \in \mathcal{R}^{m \times 1}$$

$$h[n] = \frac{1}{k} \sum_{i=n-k+1}^n (1)I[i]$$

Window size 'k'

$$h[n] = \frac{1}{k} \begin{bmatrix} 1 \\ 1 \\ \vdots \\ \vdots \\ 1 \end{bmatrix}^T I[n - k + 1 : n]$$

https://en.wikipedia.org/wiki/Moving_average

1D Filtering: Moving Average

$$I \in \mathcal{R}^{m \times 1}$$

$$h[n] = \frac{1}{k} \sum_{i=n-k+1}^n (1)I[i]$$

Window size 'k'

$$h[n] = \frac{1}{k} \begin{bmatrix} 1 \\ 1 \\ \vdots \\ 1 \end{bmatrix}^T \begin{bmatrix} I[n - k + 1 : n] \end{bmatrix}$$

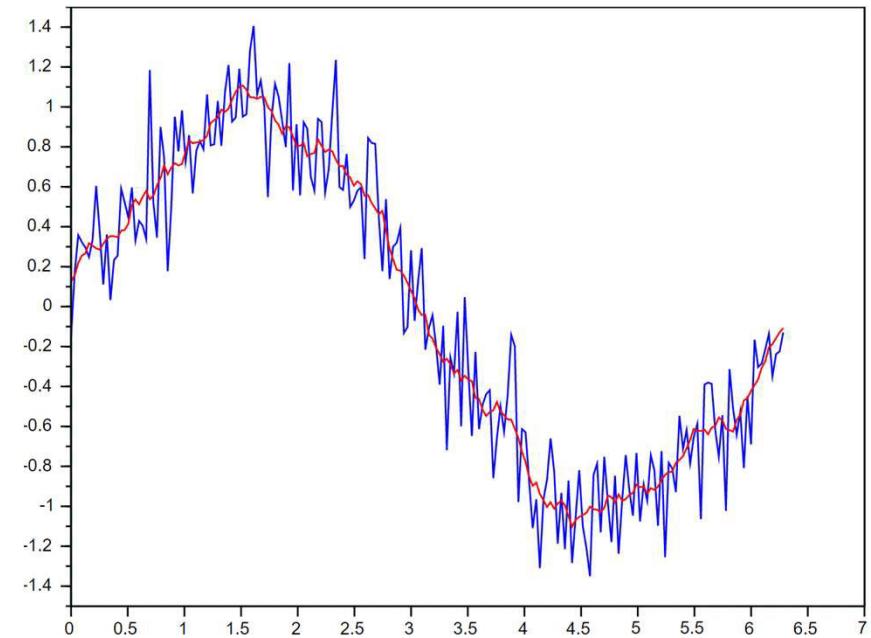

https://en.wikipedia.org/wiki/Moving_average

$$\begin{bmatrix} 0 \\ 0 \\ \vdots \\ 1 \end{bmatrix}$$

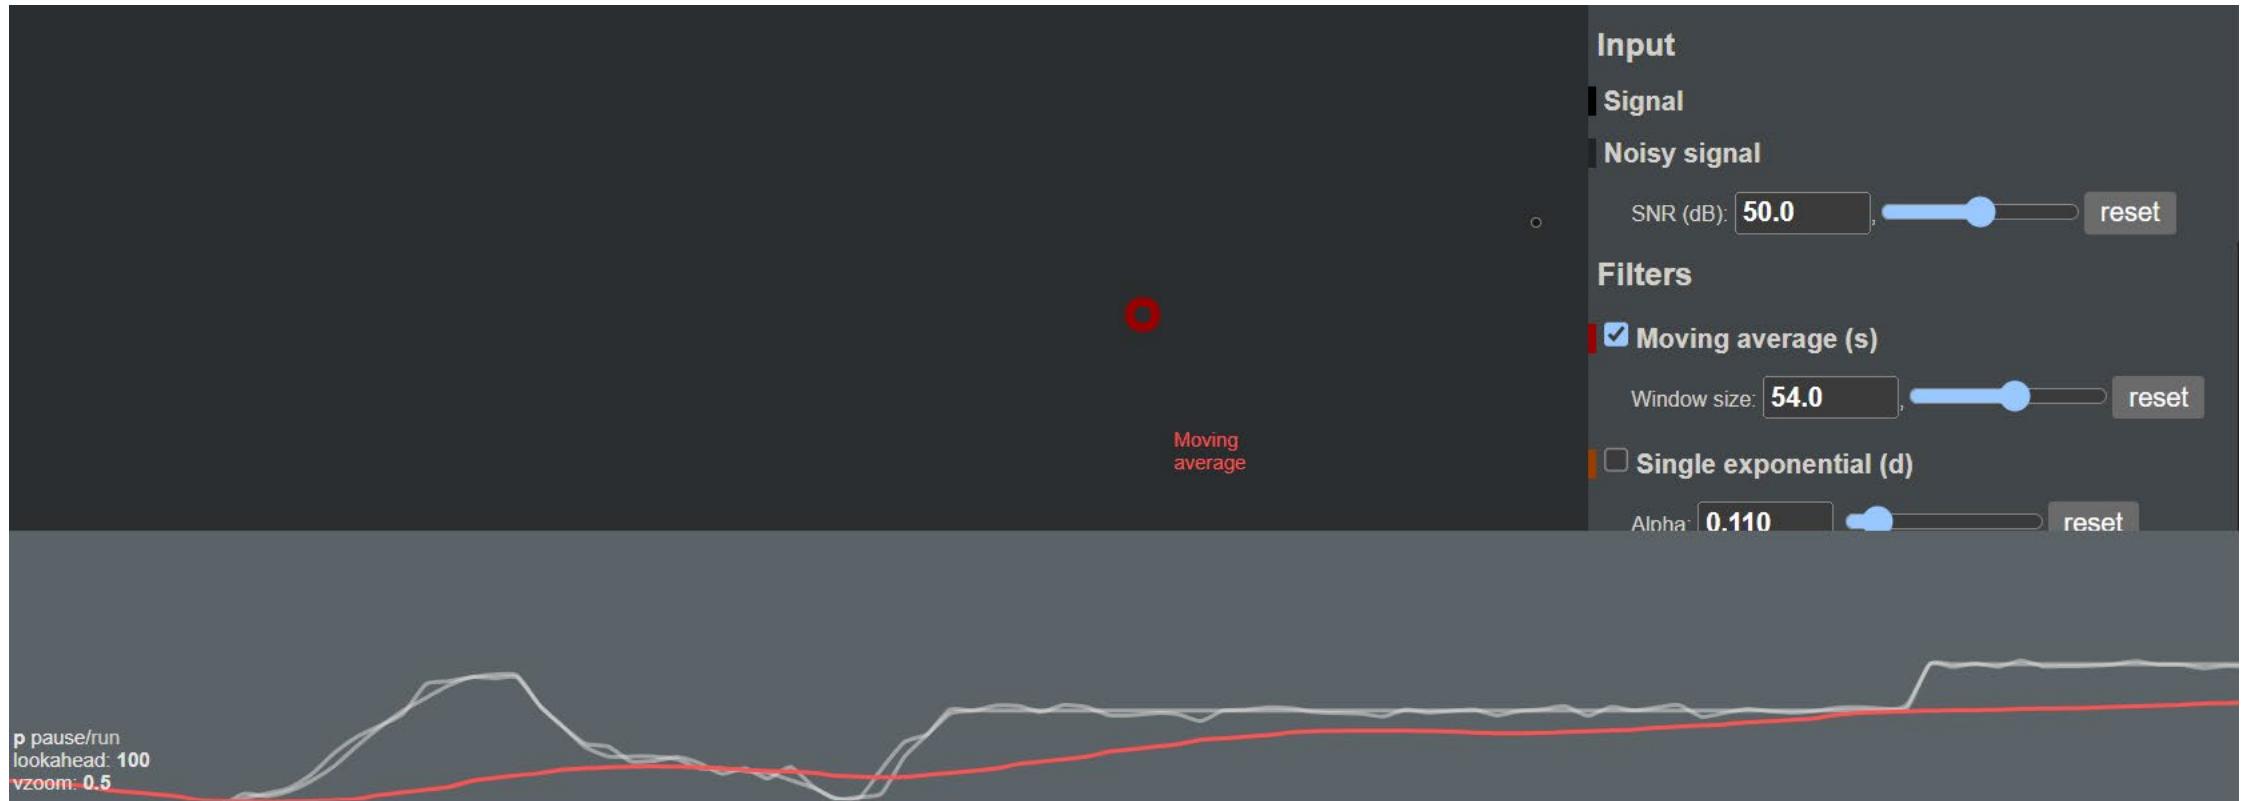

What is this filter?

$$I[n - k/2 : n + k/2]$$

What is the difference?

Filtering Demo

<https://gery.casiez.net/1euro/InteractiveDemo/>

Image Filtering

Compute function of local neighborhood at each position:

$$h[m, n] = \sum_{k,l} f[k, l] I[m + k, n + l]$$

Window size 'k' and 'l'

Image Filtering

Compute function of local neighborhood at each position:

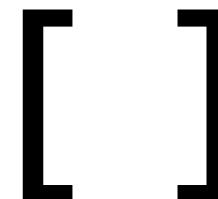

h=output

I=image

$$h[m, n] = \sum_{k, l} f[k, l] I[m + k, n + l]$$

2d coords=k, l

2d coords=m, n

Fundamental Equations of Computer Vision

1. Image Filtering

$$h[m, n] = \sum_{k, l} f[k, l] I[m + k, n + l]$$

2. Optical Flow

$$I(x, y, t) = I(x + \Delta x, y + \Delta y, t + \Delta t)$$

3. Camera Geometry

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \ \mathbf{t}] \mathbf{X} \quad x^T F x' = 0$$

4. Machine Learning

$$\arg \min_{\mathbf{S}} \sum_{i=1}^k \sum_{\mathbf{x} \in S_i} \|\mathbf{x} - \boldsymbol{\mu}_i\|^2. \quad y = \varphi(\sum_{i=1}^n w_i x_i + b) = \varphi(\mathbf{w}^T \mathbf{x} + b)$$

Example: Box Filter / Kernel

$$f[\cdot, \cdot]$$
$$\frac{1}{9} \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

Image Filtering

$$f[\cdot, \cdot] \frac{1}{9} \begin{matrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{matrix}$$

$I[.,.]$

$$h[m, n] = \sum_{k, l} f[k, l] I[m + k, n + l]$$

Box Filter / Kernel

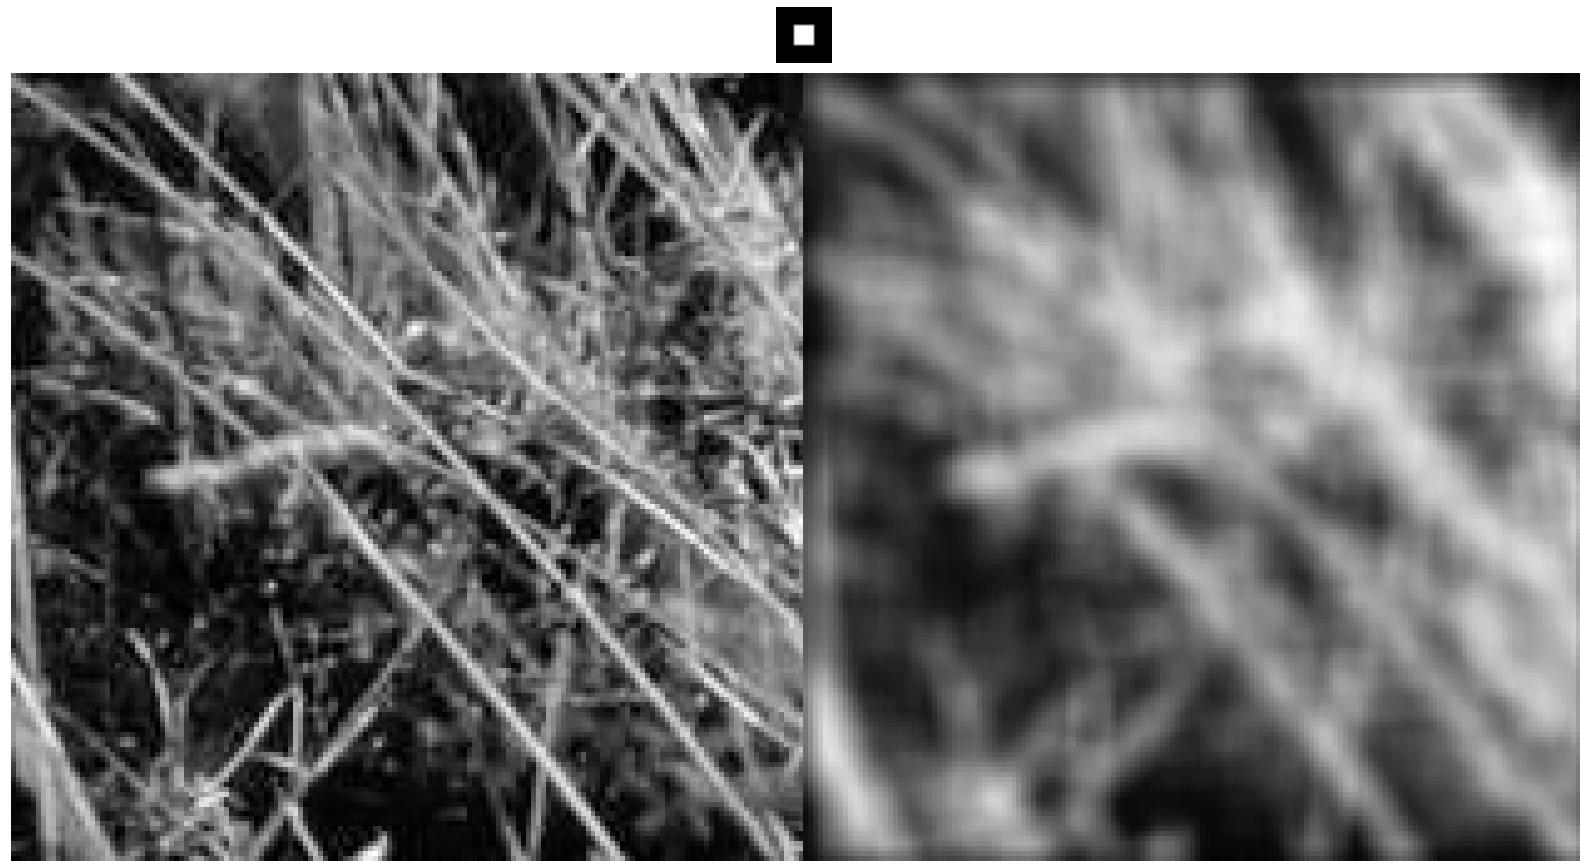

What does it do?

- Replaces each pixel with an average of its neighborhood
- Achieve smoothing effect (remove 'sharp' features)
- Why does it sum to one?

$$\frac{1}{9} f[\cdot, \cdot]$$

1	1	1
1	1	1
1	1	1

Smoothing with Box Filter

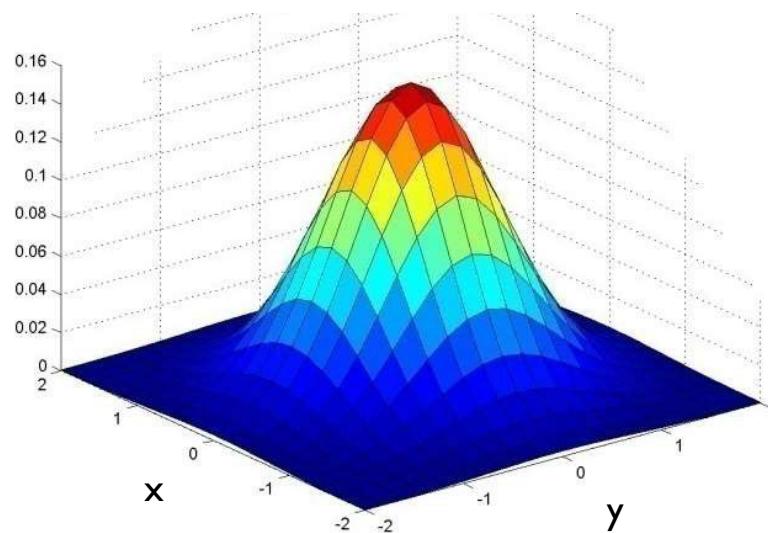

$$f[\cdot, \cdot] \frac{1}{9} \begin{array}{|c|c|c|} \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline \end{array}$$

Smoothing with Box Filter

Linear Filter Properties

Linearity:

$$\text{imfilter}(I, f_1 + f_2) =$$

$$\text{imfilter}(I, f_1) + \text{imfilter}(I, f_2)$$

Shift/translation invariance:

Same behavior given intensities regardless of pixel location m, n

$$\text{imfilter}(I, \text{shift}(f)) = \text{shift}(\text{imfilter}(I, f))$$

Gaussian Filter Properties

Gaussian convolved with Gaussian...
...is another **Gaussian**

- So can smooth with small-width kernel, repeat, and get same result as larger-width kernel
- Convoluting twice with Gaussian kernel of width σ is same as convoluting once with kernel of width $\sigma\sqrt{2}$

Separable kernel

- Factors into product of two 1D Gaussians

Image Filtering Applications

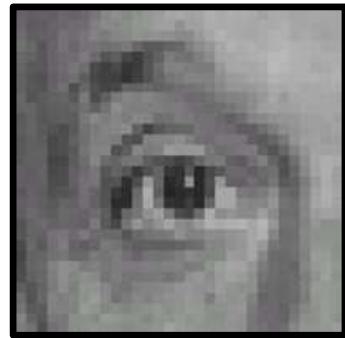

Compute function of local neighborhood at each position:

$$h[m, n] = \sum_{k,l} f[k, l] I[m + k, n + l]$$

Really important!

- **Enhance images**
 - Denoise, resize, increase contrast, etc.
- **Extract information** from images
 - Texture, edges, distinctive points, etc.
- **Detect patterns**
 - Template matching

Filters in Practice

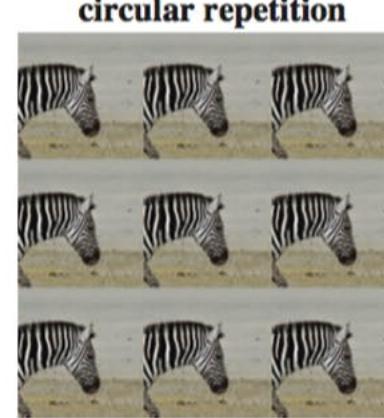

What about near the edge?

- The filter window falls off the edge of the image
- Need to extrapolate (padding)
- Methods:
 - clip filter (black / zero padding)
 - wrap around
 - copy edge
 - reflect across edge

Input

zero padding

circular repetition

mirror edge pixels

repeat edge pixels

ground truth

Correlation and Convolution

Definition

- **2D correlation**

$$h[m, n] = \sum_{k, l} f[k, l] I[m + k, n + l]$$

e.g., `h = scipy.signal.correlate2d(f, I)`

* Symmetric in the geometric sense, not in the matrix linear algebra sense.

Filtering

Definition

- 2D correlation

$$h[m, n] = \sum_{k, l} f[k, l] I[m + k, n + l]$$

e.g., `h = scipy.signal.correlate2d(f, I)`

- 2D convolution

$$h[m, n] = \sum_{k, l} f[k, l] I[m - k, n - l]$$

e.g., `h = scipy.signal.convolve2d(f, I)`

Convolution is the same as correlation with a 180° rotated filter kernel.
Correlation and convolution are identical when the filter kernel is symmetric*.

* Symmetric in the geometric sense, not in the matrix linear algebra sense.

Convolution Properties

Commutative: $a * b = b * a$

- Conceptually no difference between filter and signal
- But filtering implementations might break this equality, e.g., image edges

Associative: $a * (b * c) = (a * b) * c$

- Often apply several filters one after another: $((a * b_1) * b_2) * b_3$
- This is equivalent to applying one filter: $a * (b_1 * b_2 * b_3)$
- Why important?
- Correlation is **NOT** associative (rotation effect)

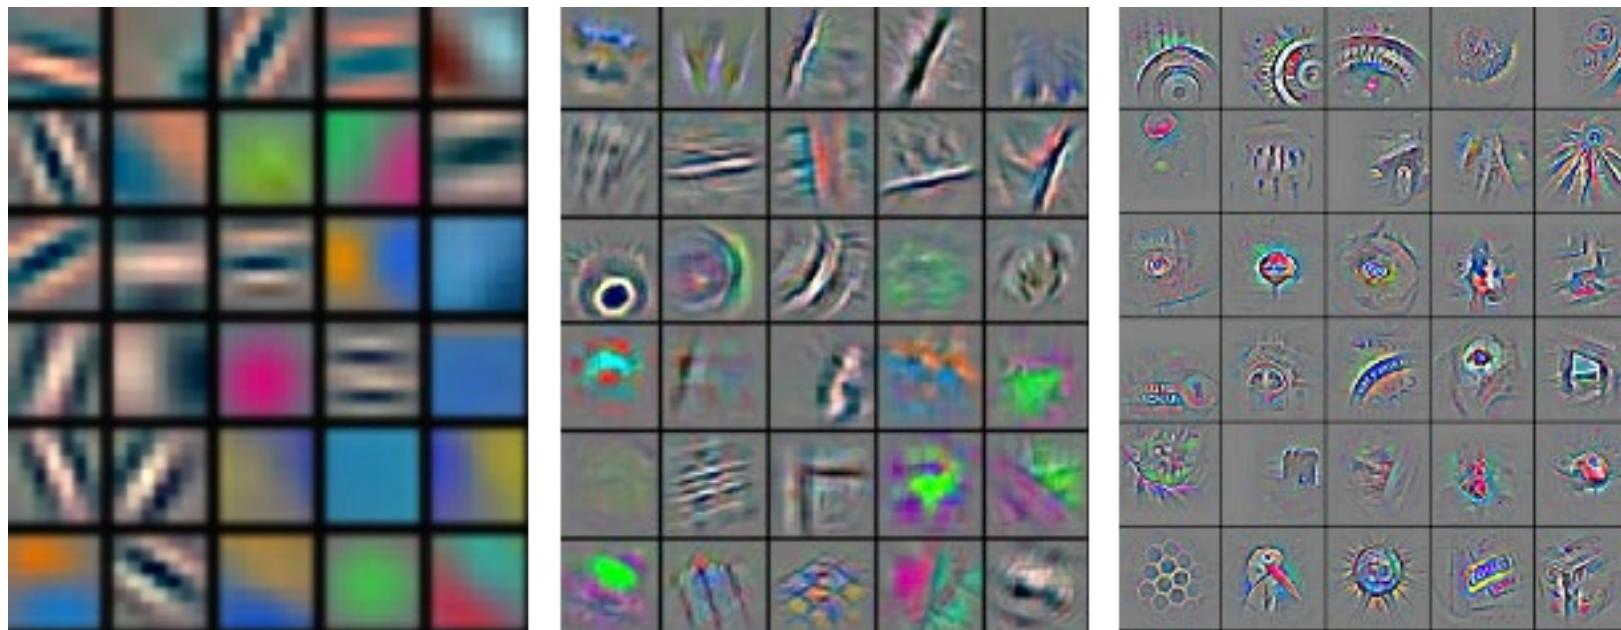

Distributes over addition: $a * (b + c) = (a * b) + (a * c)$

Scalars factor out: $ka * b = a * kb = k(a * b)$

Identity: unit impulse $e = [0, 0, 1, 0, 0]$, $a * e = a$

Convolution in Convolutional Neural Networks

- Convolution is the basic operation in CNNs
- Learning convolution kernels allows us to learn which ‘features’ provide useful information in images.

Linear Filters

Linearity:

$$\text{imfilter}(I, f_1 + f_2) = \text{imfilter}(I, f_1) + \text{imfilter}(I, f_2)$$

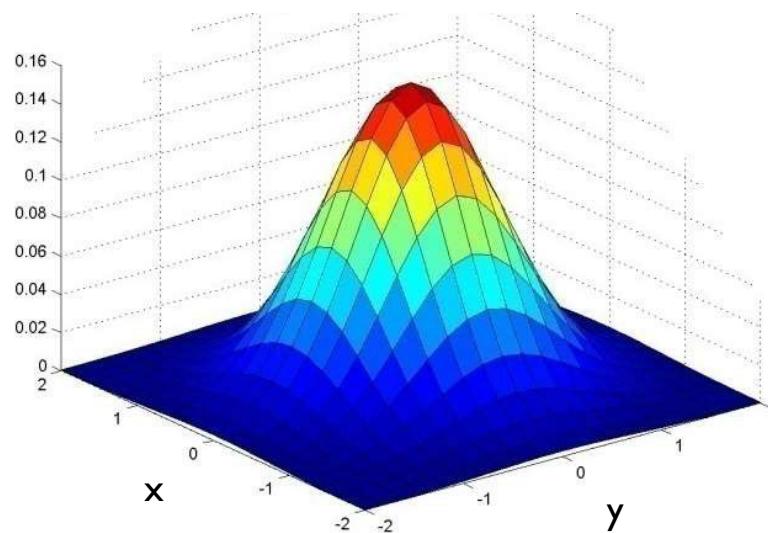

Shift/translation invariance:

Same behavior given intensities regardless of pixel location m,n

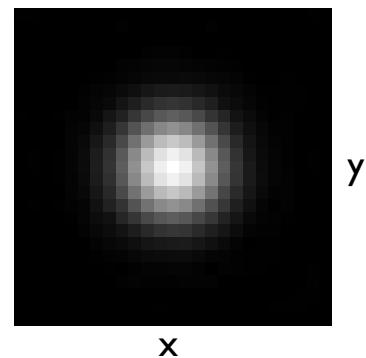

$$\text{imfilter}(I, \text{shift}(f)) = \text{shift}(\text{imfilter}(I, f))$$

- All convolution filters are both linear and shift-invariant.
- Any linear, shift-invariant (LSI) operator can be represented as a convolution.

Gaussian Filter / Kernel

Viewed
from top

$$G_{\sigma} = \frac{1}{2\pi\sigma^2} e^{-\frac{(x^2+y^2)}{2\sigma^2}}$$

x	0.003	0.013	0.022	0.013	0.003
y	0.013	0.059	0.097	0.059	0.013
x	0.022	0.097	0.159	0.097	0.022
y	0.013	0.059	0.097	0.059	0.013
x	0.003	0.013	0.022	0.013	0.003

Filter/Kernel size 5 x 5,
Standard deviation $\sigma = 1$

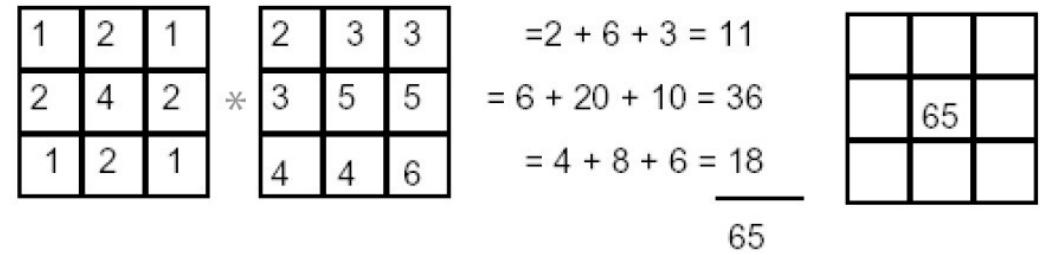

Separability of the Gaussian Filter

- The 2D Gaussian can be expressed as the product of two functions, one a function of x and the other a function of y
- In this case, the two functions are the (identical) 1D Gaussian:

$$\begin{aligned} G_\sigma(x, y) &= \frac{1}{2\pi\sigma^2} \exp^{-\frac{x^2 + y^2}{2\sigma^2}} \\ &= \left(\frac{1}{\sqrt{2\pi}\sigma} \exp^{-\frac{x^2}{2\sigma^2}} \right) \left(\frac{1}{\sqrt{2\pi}\sigma} \exp^{-\frac{y^2}{2\sigma^2}} \right) \end{aligned}$$

Separability Example

2D convolution (center location only):

$$\begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 2 & 4 & 2 \\ \hline 1 & 2 & 1 \\ \hline \end{array} * \begin{array}{|c|c|c|} \hline 2 & 3 & 3 \\ \hline 3 & 5 & 5 \\ \hline 4 & 4 & 6 \\ \hline \end{array} = \begin{array}{r} = 2 + 6 + 3 = 11 \\ = 6 + 20 + 10 = 36 \\ = 4 + 8 + 6 = 18 \\ \hline 65 \end{array}$$

The filter factors into a product of 1D filters:

$$\begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 2 & 4 & 2 \\ \hline 1 & 2 & 1 \\ \hline \end{array} = \begin{array}{|c|} \hline 1 \\ \hline 2 \\ \hline 1 \\ \hline \end{array} \times \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline \end{array}$$

Perform convolution along rows:

$$\begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline \end{array} * \begin{array}{|c|c|c|} \hline 2 & 3 & 3 \\ \hline 3 & 5 & 5 \\ \hline 4 & 4 & 6 \\ \hline \end{array} = \begin{array}{|c|c|c|} \hline 11 & & \\ \hline 18 & & \\ \hline 18 & & \\ \hline \end{array}$$

Followed by convolution along the remaining column:

$$\begin{array}{|c|} \hline 1 \\ \hline 2 \\ \hline 1 \\ \hline \end{array} * \begin{array}{|c|c|c|} \hline 11 & & \\ \hline 18 & & \\ \hline 18 & & \\ \hline \end{array} = \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & 65 & \\ \hline & & \\ \hline & & \\ \hline \end{array}$$

Separability Use

$M \times N$ image, $P \times Q$ filter

- 2D convolution: $\sim MNPQ$ multiply-adds
- Separable 2D: $\sim MN(P+Q)$ multiply-adds

Speed up = $PQ/(P+Q)$ 9x9 filter = $\sim 4.5x$ faster

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \times \begin{bmatrix} 1 & 2 & 1 \end{bmatrix}$$

Sobel Filter

```
>> I = img_to_float32( io.imread( 'luke.jpg' ) )

Practice

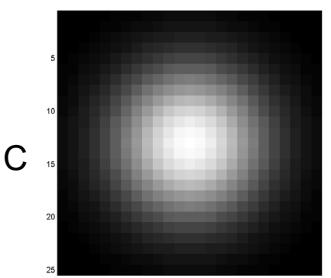

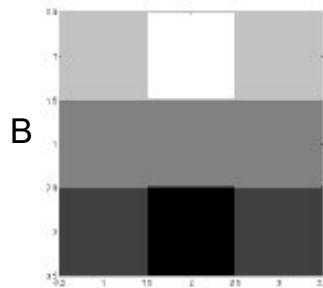

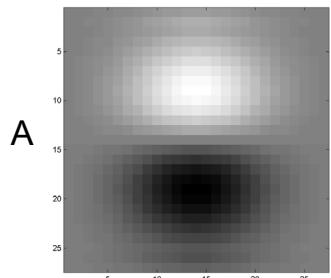

* = Convolution operator

$$1) \underline{\quad} = D * B$$

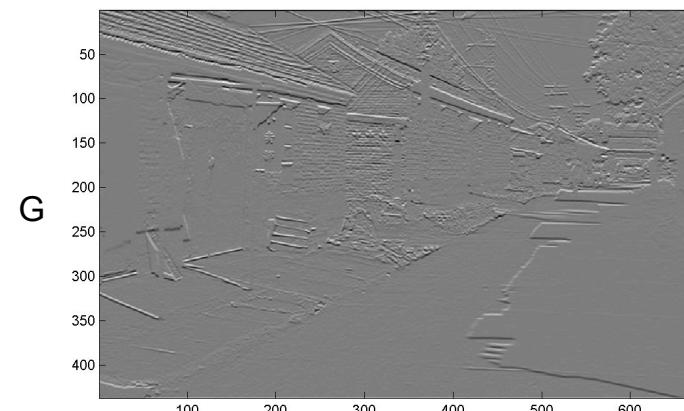

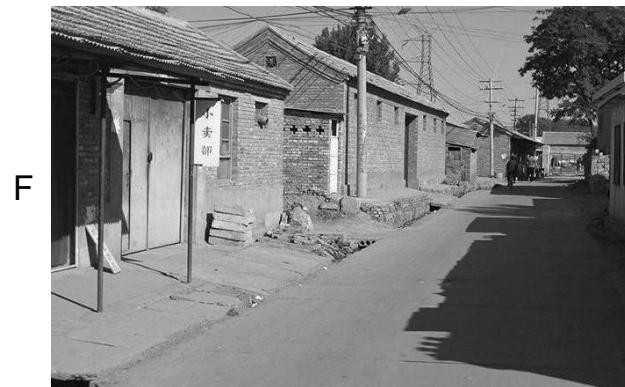

$$2) A = \underline{\quad} *$$

$$3) F = D * \underline{\quad}$$

$$4) \underline{\quad} = D * D$$

Derek Hoiem

Kaveh Fathian

Practice

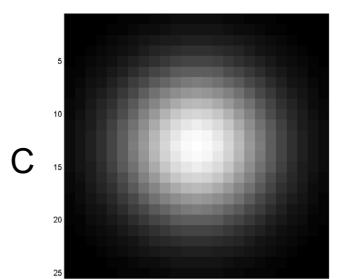

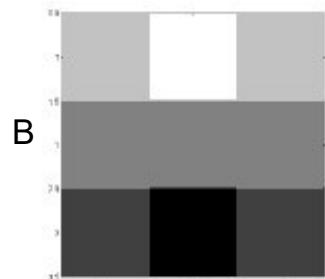

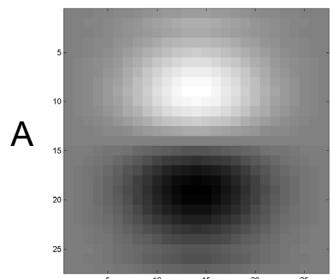

* = Convolution operator

$$1) G = D * B$$

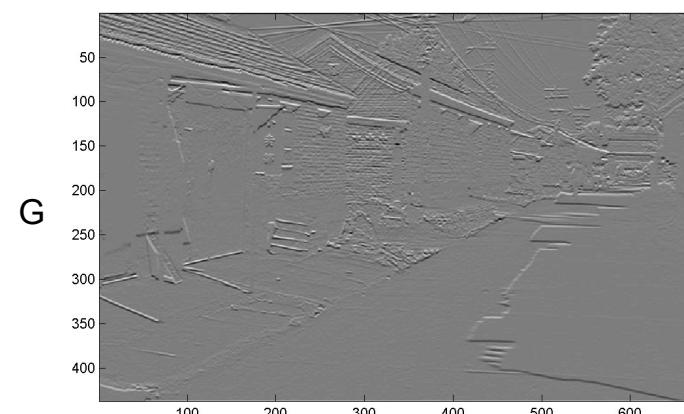

$$2) A = B * C$$

$$3) F = D * E$$

$$4) I = D * D$$

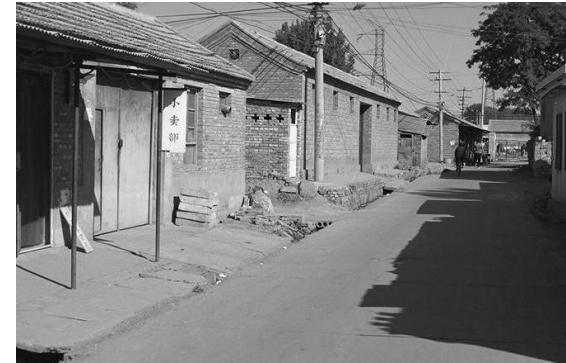

Derek Hoiem

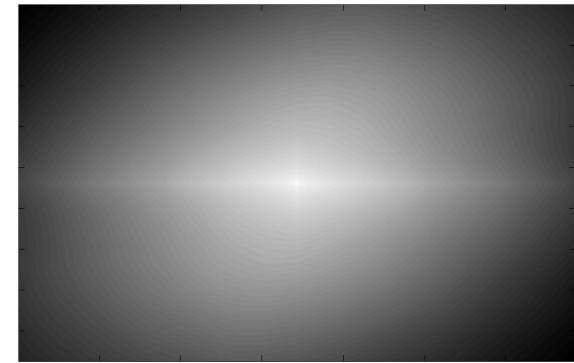

Kaveh Fathian

Convolution

D (275 x 175 pixels)

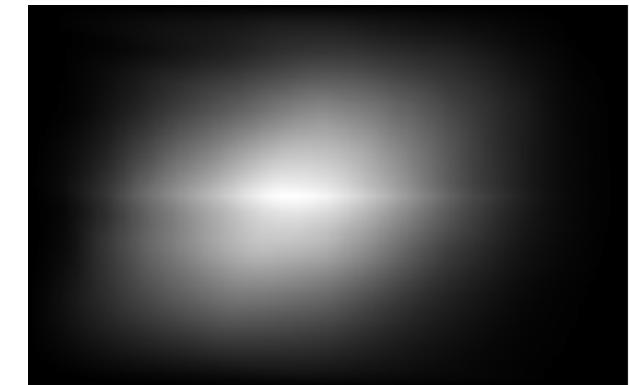

I (275 x 175 pixels)

```
>> D = img_to_float32( io.imread( 'convexample.png' ) )  
>> I = convolve2d( D, D )  
>> np.max(I) 1.1021e+04
```

I_norm

```
# Normalize for visualization  
>> I_norm = (I - np.min(I)) / (np.max(I) - np.min(I))  
>> plt.imshow( I_norm )
```

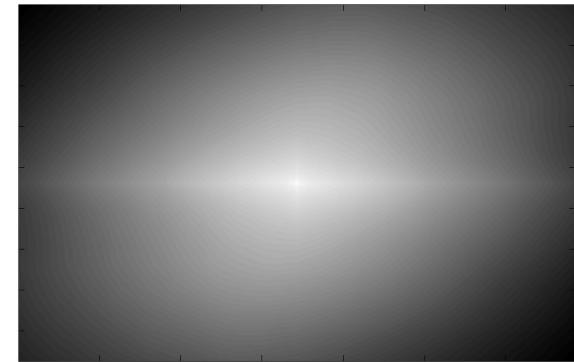

Zero padding causes black regions

Convolution

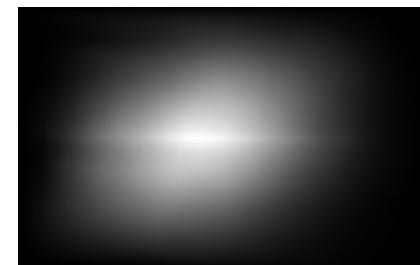

D (275 x 175 pixels)

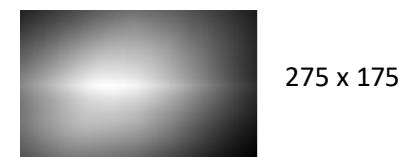

I (275 x 175 pixels)

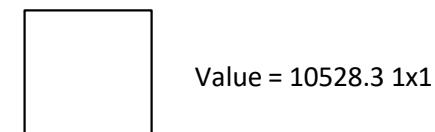

```
>> I = convolve2d( D, D, mode='full' )  
(Default; pad with zeros)
```

```
>> I = convolve2d( D, D, mode='same' )  
(Return same size as D)
```

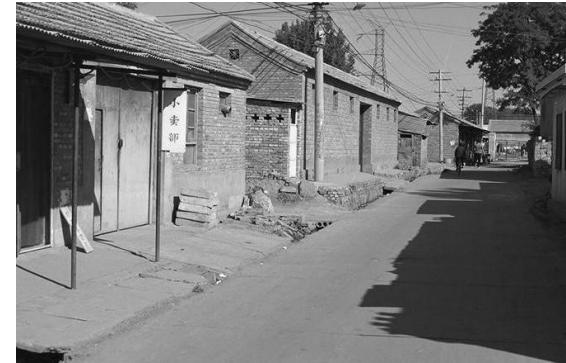

```
>> I = convolve2d( D, D, mode='valid' )  
(No padding)
```

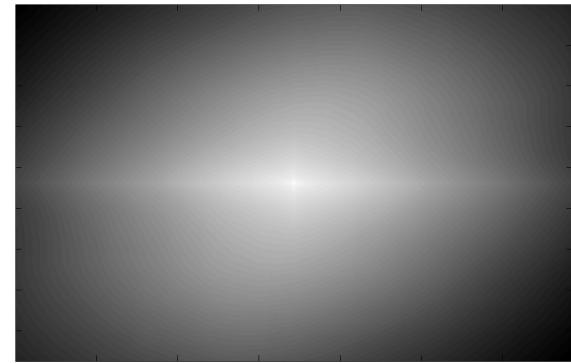

Convolution

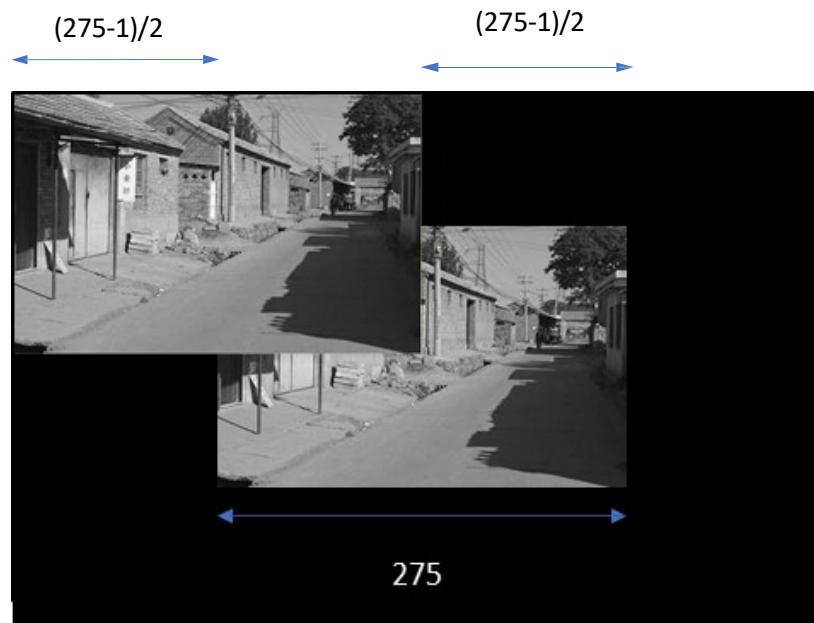

D (275 x 175 pixels)

I (275 x 175 pixels)

```
>> I = convolve2d( D, D, mode='full' )  
(Default; pad with zeros)
```

For x: $275 + (275-1)/2 + (275-1)/2 = 549$

I_norm (549 x 349 pixels)

Correlation

- When the filter ‘looks like’ the image = ‘template matching’
- Filtering viewed as comparing an image of what you want to find against all image regions.
- For **symmetric** filters: use either convolution or correlation.
- For **nonsymmetric** filters: correlation is template matching.

$$h[m, n] = \sum_{k, l} f[k, l] I[m + k, n + l]$$

e.g., `h = scipy.signal.correlate2d(f, I)`

As brightness in I increases, the response in h will increase, as long as f is positive.

Correlation

Let's see if we can use correlation to 'find' the parts of the image that look like the filter

$D (275 \times 175 \text{ pixels})$.

```
>> f = D[ 57:117, 107:167 ]
```

Expect response 'peak' in middle of I

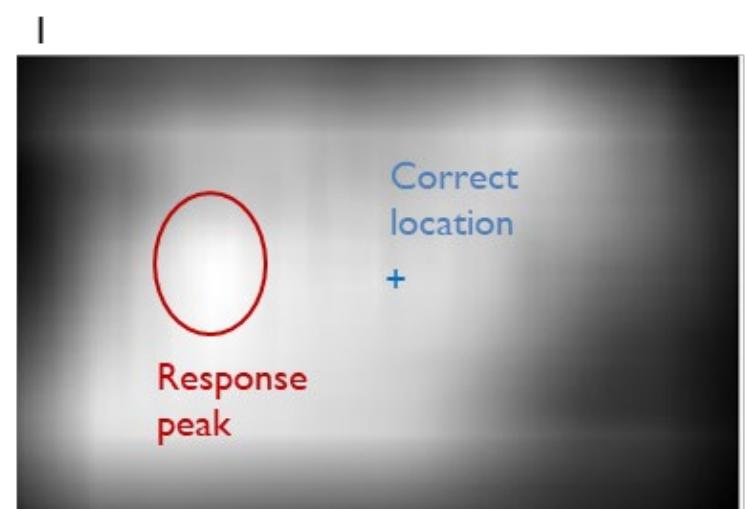

```
>> I = correlate2d( D, f, 'same' )
```

Hmm...

That didn't work – why not?

f
 61×61

Correlation

Let's see if we can use correlation to 'find' the parts of the image that look like the filter

D (275×175 pixels).

```
>> f = D[ 57:117, 107:167 ]
```

Expect response 'peak' in middle of I

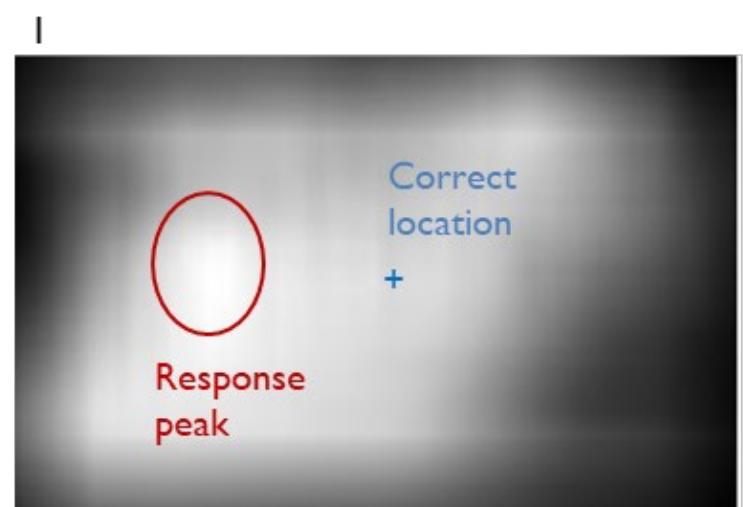

f
 61×61

```
>> I = correlate2d( D, f, 'same' )
```

Hmm...

That didn't work – why not?

Overall brighter regions will give higher correlation response
 -> not useful!

Correlation

OK, so let's subtract the mean

```
>> f = D[ 57:117, 107:167 ]  
>> f2 = f - np.mean(f)  
>> D2 = D - np.mean(D)
```

Now zero centered.

Score is higher only when dark parts match and when light parts match.

```
>> I2 = correlate2d( D2, f2, 'same' )
```

D2 (275 x 175 pixels)

f2
61 x 61

Remember –
float data type –
goes negative!

I2

Correlation

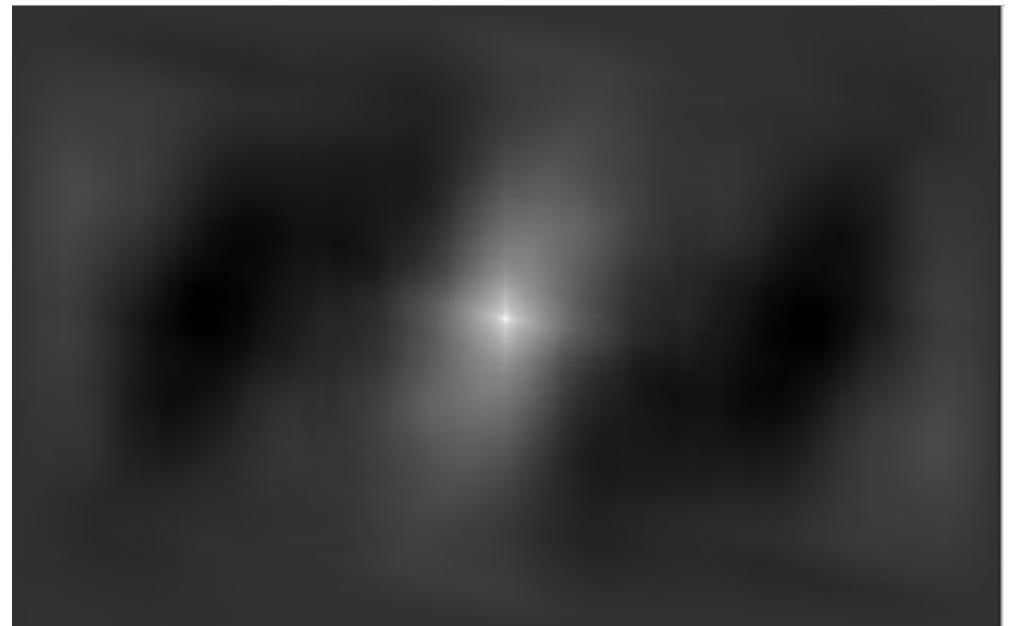

Or our original example: D2 correlated with itself

```
>> I3 = correlate2d( D2, D2, 'full' )
```

D2 (275 x 175 pixels)

I3

Correlation vs. Convolution

What happens with convolution?

```
>> f = D[ 57:117, 107:167 ]  
>> f2 = f - np.mean(f)  
>> D2 = D - np.mean(D)           I2  
>> I2 = convolve2d( D2, f2, 'same' )
```

D2 (275 x 175 pixels)

f2
61 x 61

Non-Linear Filters

- **Rank filters** are non-linear filters based on ordering of gray levels
 - e.g., median, min, max, range filters
- **Median filter** operates over a window by selecting the median intensity in the window

Salt and Pepper Noise

3 x 3 Mean Filter

11 x 11 Mean Filter

Salt and Pepper Noise

3 x 3 Median Filter

11 x 11 Median Filter

Median filters

- Operates over a window by selecting the median intensity in the window
- What advantage does a median filter have over a mean filter?
- Is a median filter a kind of convolution?
- Interpretation: Median filtering is sorting
